(Q-2)

➢ Suggest changes that should be done in order to support any data type (as opposed to only an int data type)

1. I would like to suggest the first changes to the **Node.java** class where I defined the methods like left, right and num.
➔ This class should be changed from **int** to support generic fields of data types like List, String, Date, Character, etc.

2. Create a **ConvertDatatypeUtils** class to convert String values to appropriate data types in the **deserialize ()** Method.

➔ To conclude, I believe that these two changes will support any data type.
